APPENDIX C
INDEX MAP FOR PLATE 2

EXPLANATION

Volcanic features are identified (and listed in appendix B) by location number. Each number consists of two parts which, when written, are separated by a dash. The first part is a number from 6 to 19 that represents the 2 degree sheet in which most of the feature is located. This number appears in the upper left corner of the respective 2 degree sheet, indicated by dashed lines on this map. The second part of the location number was assigned sequentially when the feature was digitized (and after assigning numbers for the faults and folds on plate 1) and identifies the feature within a particular 2 degree sheet. On this map, each feature is circled and attached to its sequential number with a leader line. For example, the Pavant lavas, location number 8-28, was the twenty-eight feature digitized in the Delta (eighth) 2 degree sheet.
